## AMENDMENTS TO CLAIMS

Rewrite the claims as follows:

1. (currently amended) An optical pickup apparatus for accessing an optical recording medium, comprising:

a light source unit emitting one of a plurality of laser beams having different wavelengths, the light source unit including a first laser diode emitting a laser beam having a first wavelength and a second laser diode emitting a laser beam having a second wavelength;

an optical system focusing said one of the plurality of laser beams, emitted by the light source unit, onto a recording surface of the recording medium;

a photodetector unit receiving reflection beams, which are reflected from the recording medium in response to said one of the plurality of laser beams focused by the optical system, to generate detection signals from the received reflection beams; and

a holographic unit having a first hologram suited to the first laser diode and a second hologram suited to the second laser diode, the first hologram provided to diffract a reflection beam of the laser beam of the first laser diode to the photodetector, the second hologram provided to diffract a reflection beam of the laser beam of the second laser diode to the photodetector, wherein one of the first and second holograms in the holographic unit includes a first tracking detection region suited to the reflection beam of the laser beam of the first laser diode, and a second tracking detection region suited to the reflection beam of the laser beam of the second diode, and a surface area of the second tracking detection region.

2. (original) The optical pickup apparatus according to claim 1 wherein the photodetector is provided to receive the diffracted beams from each of the first hologram and the second hologram.

## Claim 3 (canceled)

- 4. (original) The optical pickup apparatus according to claim 1 wherein the first hologram and the second hologram of the holographic unit are provided in a single optical module.
- 5. (original) The optical pickup apparatus according to claim 4 wherein the first hologram and the second hologram are arranged with a spacing between opposing surfaces of the first and second holograms.
- 6. (original) The optical pickup apparatus according to claim 1 wherein the first hologram and the second hologram of the holographic unit are respectively configured into a first polarizing hologram and a second polarizing hologram.
- 7. (original) The optical pickup apparatus according to claim 6 wherein a focusing detection region of each of the first and second polarizing holograms has an optimum grating depth to provide a predetermined diffraction efficiency for one of the laser beam wavelengths of the first and second laser diodes.
- 8. (original) The optical pickup apparatus according to claim 6 wherein each of the first and second polarizing holograms contains an obliquely deposited film.
- 9. (original) The optical pickup apparatus according to claim 6 wherein each of the first and second polarizing holograms contains an oriented organic film.

## Claims 10-12 (canceled)

13. (original) The optical pickup apparatus according to claim 1 wherein the first laser diode and the second laser diode are respectively provided on a first LD chip having a decentered emission point and a second LD chip having a decentered emission point, the first and second LD chips being arranged in parallel such that a distance between the decentered emission points of the LD chips is smaller than a distance between centers of the LD chips.

14. (currently amended) An optical disk drive including an optical pickup apparatus, said optical pickup apparatus comprising:

a light source unit emitting one of a plurality of laser beams having different wavelengths, the light source unit including a first laser diode emitting a laser beam having a first wavelength and a second laser diode emitting a laser beam having a second wavelength;

an optical system focusing said one of the plurality of laser beams, emitted by the light source unit, onto a recording surface of an optical recording medium;

a photodetector unit receiving reflection beams, which are reflected from the recording medium in response to said one of the plurality of laser beams focused by the optical system, to generate detection signals from the received reflection beams; and

a holographic unit having a first hologram suited to the first laser diode and a second hologram suited to the second laser diode, the first hologram provided to diffract a reflection beam of the laser beam of the first laser diode to the photodetector, the second hologram provided to diffract a reflection beam of the laser beam of the second laser diode to the photodetector, wherein one of the first and second holograms in the holographic unit includes a first tracking detection region suited to the reflection beam of the laser beam of the first laser diode, and a second tracking detection region suited to the reflection

beam of the laser beam of the second diode, and a surface area of the second tracking detection region being larger than a surface area of the first tracking detection region.

Claims 15-22 (canceled)
